

NeoPrediX AG

Business Strategies

The intelligent prediction software from NeoPrediX supports decision-makers in clinics in optimizing care and therapy for each individual patient. The clinical care of children is supported and optimized by scientifically based algorithms and artificial intelligence. In this way, we facilitate therapeutic decisions for the most vulnerable patients, the newborn. To avoid negative effects and complications, infants are treated individually, specifically and in a timely manner.

Core technologies and services

NeoPrediX develops clinical decision support software (and platforms) for perinatal, neonatal and pediatric applications to assess, optimize and personalize medical strategies. We use intelligent algorithms and digital health solutions for newborn care, developed by experienced scientists, pediatricians and neonatologists and based on comprehensive medical data and scientific knowledge.
