## **HySeDi GmbH**

### **Business strategy**

HySeDi is the first deep tech company specialized in optimizing the entire supply chain from sanitary consumption & hygiene to warehousing, management, ordering, delivery and production. Not sexy, but globally commanded. The collected and processed data enables better service, and also a high new standard of hygiene. "We protect Resources, Health & Life."

### **Core technologies and services**

The heart of HySeDi is the B2B platform in which data is collected and made available to stakeholders in a processed form.

In sanitary facilities, sensors, lidar and cams generate data in real time; in addition in the warehouse, QR-/barcodes and RFID; FM and management exchange data bidirectionally with the cloud. The platform controls the deployment of service personnel for filling and cleaning. Specialty wholesalers and producers retrieve useful info for them, and act accordingly, even before orders are automatically triggered. APIs are used to integrate tools that enable them to accurately calculate future demand and optimize the utilization of freight areas and delivery routes.

Preventing the spread of germs and viruses is a particular priority. This is implemented with a protected manual solution and controlled and logged with IoT.

### **Patents – Licenses – Cooperations**

Patents have been applied for throughout Europe for the function of the platform and the washbasin/siphon combination (to prevent nosocomial infections); other states will follow.

### **Distribution**

Distribution is primarily through specialized wholesalers (sanitary equipment / hygiene products).
