

## ***Medespro - Medical design project***

### **Business Strategies**

Promoting health literacy and improving communication between people with chronic wounds and their caregivers by using the VulnaCurae app - a self-management tool for wound documentation for patients. The aim is to provide a comprehensive wound documentation and to relieve the burden on those affected and the healthcare providers.

### **Core technologies and services**

VulnaCurae enables a mobile wound documentation including the wound history of patients with chronic wounds. To avoid gaps in care and documentation of wound management, patients become active stakeholders within the treatment team (e.g., patient, physicians, nurses and pharmacist) to ensure a greater transparency about the current wound status. With automatic wound measurement, AI-driven identification of wound parameters and an intuitive user interface, patients receive the support they need for optimal wound documentation. The app can be used without any user instructions.
